

Comprehensive, cloud-based email security

Highly effective
inbound and outbound
spam and virus filtering

Integrated email
continuity

Cost-effective and
easy to use

geezit Cloudscan is a cloud-based email security solution that offers comprehensive spam and virus protection and built-in continuity with always-on backup mail service. The service is compatible with any email infrastructure and can be implemented in minutes.

KEY BENEFITS

- » **Full cloud-based solution that requires no hardware or software**
No need to spend thousands on setting up a continuity service with continual hardware maintenance.
- » **Built-in email continuity with automatic queuing and on-demand mail service**
When your email server goes down, geezit Cloudscan doesn't! You can continue to send and receive emails and continue with business as usual.
- » **Reduce email downtime with multiple delivery points**
In the past, when your Internet service provider went down, so did your access to email. If you have multiple Internet providers, geezit Cloudscan ensures that your emails route through your backup connection, ensuring that you never lose a minute of email delivery.
- » **Inbound/Outbound email filtering**
geezit Cloudscan scans inbound and outbound emails and attachments and prevents inappropriate messages from being sent from your network, stopping your mail server from blacklisting.
- » **Hosted individual junk mail quarantines and digests**
geezit Cloudscan releases quarantined emails in regular reports from within your email client. You can choose to receive these reports up to 3 times a day. You can also have total control over which emails you want to whitelist or blacklist.

EFFECTIVENESS

In a fraction of a second, geezit Cloudscan scans incoming messages using both traditional and leading-edge technologies to detect spam, combining message signature analysis, authenticity checks, an extensive heuristic rule set, continually evolving databases of URLs, network addresses, mail servers and other identifying elements known to be used in phishing attacks and in unsolicited bulk email, real-time message source analysis, and customisable domain-specific and user specific whitelists and blocklists. The result is a highly adaptive system and a dramatic reduction in junk email, relieving a significant burden for email users and system administrators.

NETWORK DEFENCE

geezit Cloudscan helps you reduce risk, free up network bandwidth and ease mail server load by blocking practically all spam and email threats before they reach your network.

CONTINUITY

geezit Cloudscan's email continuity feature enables you to continue accessing, responding to and sending email messages, even in the event of a network outage or an on-premise mail server outage. geezit Cloudscan queues your organisation's mail and users can continue accessing or responding to those messages via the solution's control panel, even while your mail server is offline.

VIRUS PROTECTION

geezit Cloudscan combines a traditional signature-based antivirus engine, pattern-based zero-hour virus detection and virtualisation-based threat recognition to defeat today's sophisticated and fast-moving malware threats.

INBOUND/OUTBOUND EMAIL FILTERING

geezit Cloudscan scans inbound emails and attachments and allows the automated addition of configurable disclaimers or signatures to outbound messages. The service also prevents inappropriate messages from being sent from your network – preventing your mail server from blacklisting and protecting your company's reputation in the event a server or workstation is compromised.

DIRECTORY HARVEST AND DOS ATTACK PREVENTION

By filtering inbound SMTP traffic in the cloud before it reaches your network, the service protects your infrastructure against directory harvesting, large-scale spam runs, denial of service attacks and other threats.

INTUITIVE WEB-BASED CONTROL PANEL

The easy-to-use web-based control panel allows administrators and users to effectively and efficiently manage their email security and access quarantined messages as well as queued messages in the event of a mail server failure.

INDIVIDUAL JUNK MAIL QUARANTINES AND DIGESTS

With geezit Cloudscan, customers can retain detected spam messages in a quarantine hosted outside the company's network. Users can access the quarantine at any time and receive a convenient, automatically emailed summary of detected junk mail to quickly identify any potential false positives and release these from the quarantine. The digest messages can be scheduled as infrequently as once per week or as frequently as three times per day.

CONFIGURABLE USER PREFERENCES

Administrators can set the spam filtering configuration for a given user, or can delegate the ability to do so to the individual users so that the service works for their specific needs.

MESSAGE LOGGING AND SEARCH

Through geezit Cloudscan's comprehensive message logging, administrators can search for messages and access detailed delivery logs for all recent inbound and outbound messages. These logs include message envelope details, message headers, message size, the receiving server and the exact response from that server to help determine what happened to any given message.
